✓ Column mapping by header ✓ Column mapping by position ✓ Read from local disk ✓ Read from network share ✓ Map a role to one access level	✓ Column mapping by header ✓ Column mapping by position ✓ Read from local disk ✓ Read from network share ✓ Map a role to one or more access levels (see combined access levels)

* For Net2 v6.x, the license fee is perpetual. For Net2 v7.x and up, there is an added yearly support fee of 10% of the initial fee.

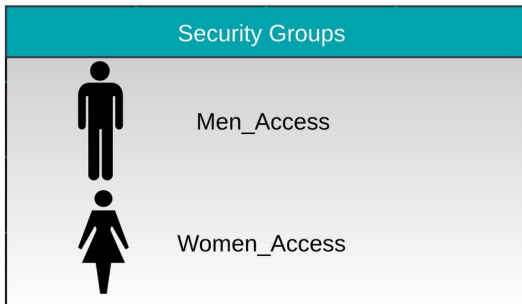

Combined access levels

With the Professional, you can have CSV column value represent a single access level in Net2. When using the Ultimate, a CSV column value can represent a combination of multiple access levels.

When a combination is required, the Net2CSVSyncServer will auto create new access levels and time zones on the fly, that offer the combined rights. Note that this allows combinations of access levels with the same door in it, where the 'Advanced access levels' offered by Net2 do not.

On the next page an attempt is made to illustrate the difference between the Professional and Ultimate, with a simple example.

John

John has the CSV role
'Men_Access'

John has the access level
'Men_Access' in Net2

John

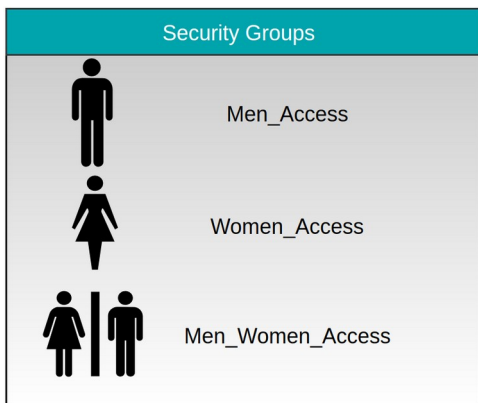

John gets a job as a janitor.

John now needs access to the restrooms for men, but also for women.

John needs an access level, which is a combination of 'Men_Access' and 'Women_Access'.

Professional

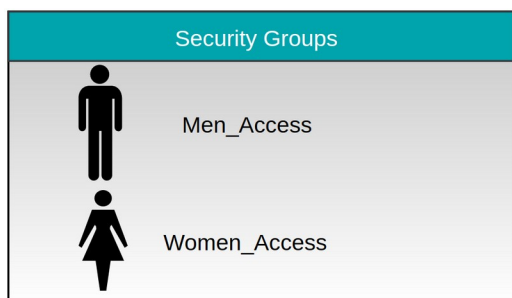

A new role and new access level
are required for the new access
rights for a janitor.

John gets the CSV role
'Men_Women_Access',
associated with a **manually**
created new access level in
Net2, that gets assigned to him.

Ultimate

John still gets a CSV role
'Men_Women_Access', but this
is now associated with both the
'Men_Access' and
'Women_Access' access levels in
Net2.

A combined access level is
automatically created in Net2
and assigned to John.
